The disciplines that is most appealing to me is philosophy. Philosophy is all about generating conclusions mechanically. It is much more than conclusions, it is concepts, rationalism behavior, morality, and everything in between. Philosophy is the power of reasoning to understand the world. Implementing the reasoning of a complex organism inside a machine is a very difficult thing to do. We are trying to make something we do not understand completely, the brain where everything, calculations, reasoning, understanding the world around us. happens. Our thoughts gradually began being implemented into machines in the 1646-1716 where Gottfried Wilhelm Leibniz made a calculator, reasoning that machine he made, the calculator, imitate our simple thoughts like, "add and subtract". There are many interesting aspects of building an agent, such as math, economics, neuroscience, and more, but the most interesting aspect I find in this field is, considering complexity, how philosophy, dating back from Aristotle, can be engraved or be a part of a machine
